TERMS OF USE

Crops Statistics of the Philippines is a publication of the Philippine Statistics Authority. The PSA reserves exclusive right to reproduce this publication in whatever form. Should any portion of this publication be included in a report/article, the title of the publication and the PSA should be cited as the source of data. The PSA will not be responsible for any information derived from the processing of data contained in this publication.

ISSN-2012-0487

FOREWORD

This is the 12th issue of Crops Statistics of the Philippines, an annual publication of the Philippine Statistics Authority (PSA). As in the previous issues, this report presents annual production statistics of 21 major crops and 20 minor priority crops with national and regional levels of disaggregation. These crops are classified into Cereals, Fruit Crops, Non-Food and Industrial Crops and Vegetables and Root Crops. In the case of banana and mango, production statistics are disaggregated by major variety. The reference period is 2010 to 2014.

The production statistics are presented in the order of the above crop classification. Each classification is preceded by a brief description of the trends of area, production and yield and the major factors affecting these trends and the major producing regions.

This report was prepared by the Crops Statistics Division (CSD) of the PSA. It serves as a ready reference for various stakeholders in the crops subsector of agriculture. The PSA continuously pursues the improvement of the delivery of its products and services. Hence, it welcomes comments and suggestions from the readers for further improvement of this report.

EXPLANATORY NOTES

Scope and Coverage

Crop production statistics are generated for all regions and provinces except Batanes. Quarterly crop surveys cover all commodities, however, this publication focuses on the following forty seven (47) major and priority crops:

	<u>MAJOR CROPS</u>	<u>PRIORITY CROPS</u>
CEREALS	Palay and corn	
FRUIT CROPS	Banana, calamansi, mango, pineapple	Durian, mandarin, mangosteen, lanzones, papaya, rambutan, orange, watermelon, tamarind
NON-FOOD & INDUSTRIAL CROPS	Abaca, coconut, coffee, rubber, sugarcane tobacco	Cacao, cashew, cotton
VEGETABLES, ROOTCROPS & TUBERS	Cabbage, camote, cassava, onion, eggplant, garlic, mongo, peanut, tomato	Asparagus, broccoli, carrots cauliflower, gabi, ginger, gourd, habitchuelas, lettuce, okra, pechay-chinese, pechay native, ubi, white potato

Sampling Methodology

The sampling design of Palay and Corn Production Survey (PCPS) was based on the results of 1991 Census of Agriculture (CAF). The survey domain was the province. It employ's a replicated two-stage stratified sampling design. The barangay was the primary sampling unit (psu), which was selected using a probability proportional to size (pps) scheme. The farming household served as the secondary sampling unit (ssu), which was selected systematically.

A non-probability survey was employed for *other crops*, crops other than palay and corn. A "5 x 5" design was used in the selection of samples with the province as the domain. The top five (5) producing municipalities were chosen from each province. From each of these municipalities, five (5) sample farmers were selected as respondents.

In this two-stage design, the municipalities served as the primary sampling units (psu), and farm households as the ultimate sampling units (usu).

Data Collection

For cereals, data collection is done quarterly during the first twelve (12) days of the month after the reference quarter. For other crops, quarterly data collection is conducted simultaneously with the monthly Farm Prices Survey (FPS) in the last ten (10) days of February, May, August and November.

Each round of the PCPS generates the following: (1) Final estimate of production for the immediate past quarter of the current survey round; (2) Forecast production for the current quarter based on standing crop; and (3) Forecast production for the next quarter based on planting intentions of farmers.

Data Review and Analysis

Data review and analysis are conducted quarterly to ascertain the accuracy of the data collected from probability and non-probability surveys. These activities start at the Provincial Operations Center (POC) after data processing using prescribed review materials. All provincial estimates undergo further data review at the regional level. All validated regional and provincial estimates are brought to the Central Office for final review. The BAS Director presides over the National Data Review, which is participated in by the Assistant Director and Division Chiefs, Regional Agricultural Statistics Officer (RASOs) and commodity specialists.

Concepts and Definitions

The following concepts and definitions are used in the generation of statistics for crops.

Area Harvested - *The actual area from which harvests are realized. This excludes crop area which were totally damaged. It may be smaller than area planted. In crop statistics, this applies to temporary crops.*

Area Planted - *The actual physical area planted. This generally applies to area reported for permanent crops and multi-harvest temporary crops.*

Bearing Trees/Bearing Hills/Bearing Vines - *The number of trees/hills/vines where harvesting has been made in the past but may or may not have borne fruits or productive during the reference period due to cyclical production pattern of the crop. Hills applies to banana. Vines applies to pepper and grapes.*

Crop Production - *Is the quantity produced and actually harvested for a particular crop during the reference period. It includes those harvested but damaged, stolen, given away, consumed, given as harvester's share, reserved etc. Excluded are those produced but not harvested due to low price, lack of demand and force majeure or fortuitous events, etc.*

Effective Area Harvested - *The actual area which is counted as many times as it was planted and harvested to same crops during the reference period. This concept applies to the harvest area reported for mono harvest temporary crops such as rice, corn, root crops and tubers and pechay.*

High Yielding Variety - *An improved cultivated variety with significantly higher yield and better quality under specific environment and improved farming conditions and practices than the traditional seed varieties being used; or any agricultural crop variety that can equal or exceed the yield of the current commercially grown variety in a particular locality. HYV may be locally or foreign bred.*

Industrial Crops - *Are Crops that are used as inputs to other industries. Examples are: rubber, castor beans, abaca and oil palm.*

Irrigated Palay - *Palay crop that requires standing water for its normal growth, not confined to lowland but also to high places where paddies are built for planting rice, requires irrigation water made available through artificial means (gravity, force, power pumps, etc.)*

Major Crops - *Refer to the top 19 crops in the Philippines, other than palay and corn which collectively account for more than 60 percent of the total crop production. These include coconut, sugarcane, banana, pineapple, coffee, mango, tobacco, abaca, peanut, mongo, cassava, sweet potato, tomato, garlic, onion, cabbage, eggplant, calamansi and rubber.*

Minor Crops - *Are all the remaining crops other than the major crops. This group accounts for about 40 percent of the total crop production.*

Non-Food Crops - *Are crops other than those used for food consumption. These are crops grown for their aesthetic values such as ornamental plants and cutflowers. These also include agriculture-derived products such as rice hay and coconut leaves.*

Permanent/Perennial Crops - *Are crops which occupy the land for a long period of time and do not need to be replaced after each harvest such as fruit trees, shrubs, nuts, etc. These crops may be productive or fruit-bearing crops. Examples are: avocado, coffee, coconut and other fruit trees.*

Priority Crops - Refer to the identified national banner crops and various regional priority crops of the then Key Commercial Crops Development Program (KCCDP), High Value Crops Development Program (HVCDP) and now the Key Commodity Road Maps of the Department of Agriculture, which are being developed because of their industrial and commercial potentials.

Rainfed Palay - Palay crop that depends solely upon rainfall for its water supply; usually planted through transplanting or direct seeding in fields with dikes that retain water. There may be dikes in the field to hold water in the case of lowland-rainfed, or none in the case of upland palay.

Root Crops - Crops with well developed underground edible roots. They are classified into roots and tubers. Roots which are more starchy and rich in carbohydrates include gabi, ubi and white potato. Tubers include beets, radish, carrots and turnips.

Temporary Crops - Crops which are grown seasonally and which growing cycle less than one year and which must be sown and planted again for production after each harvest.

Vegetable Crops - Mostly temporary crops which are either classified agronomically as such or based on purpose for which they are used, like jackfruit which on their young stage, are classified as vegetables.

White Corn - Corn grown and used mainly for human consumption, and manufacture of corn by-products such as cornstarch, corn oil, syrup, dextrins, glucose, gluten, etc.

Yellow Corn - Corn used mainly as feed grains; includes all types of corn other than white.

Yield - Indicator of productivity derived by dividing total production by the area harvested.

II. REGIONAL STATISTICS

A. CEREALS

PALAY

Palay production in the country exhibited an upward trend. It grew from 15.77 million mt in 2010 to 18.97 million mt in 2014 at an annual average growth of 4.7 percent (Figure 1). Likewise, total harvest area during the last five (5) years increased from 4.36 million hectares in 2010 to 4.74 million hectares in 2014. Central Luzon remained the top palay producer with 3.77 million mt output in 2014 or 19.8 percent of the country's total palay production. The other top producing regions were Cagayan Valley which shared 13.3 percent; Western Visayas which shared 10.8 percent; and Ilocos Region, 9.5 percent (Figure 2). Area harvested from these regions combined to 49.4 percent of the country's total (Figure 3).

In irrigated areas, palay production in 2014 reached 14.41 million mt. Central Luzon had the biggest share at 3.42 million mt. Cagayan Valley and Ilocos Region followed with 2.31 million mt and 1.34 million mt, respectively. The combined output from these regions accounted for 48.9 percent of the total irrigated palay production in 2014 (Figure 4).

In rainfed areas, palay production in 2014 was 4.56 million mt. Western Visayas was the top producer with 21.2 percent share to total rainfed palay output. Ilocos Region and Eastern Visayas followed with 10.8 percent and 9.5 percent shares, respectively (Figure 5).

CORN

Production of corn peaked at 7.77 million mt in 2014 from the 6.38 million mt level in 2010. It grew at an average annual rate of 5.1 percent (Figure 6).

Cagayan Valley remains the top producing region, contributing 1.86 million mt or 23.9 percent of the country's total corn production in 2014. SOCCSKSARGEN ranked second with 1.34 million mt, followed by Northern Mindanao with 1.20 million mt. These regions accounted for 56.5 percent of the total corn output of the country (Figure 7). Total harvest area from these regions summed up to 47.5 percent of the country's total corn hectareage of 2.61 million hectares (Figure 8).

White corn production reached 2.26 million mt in 2014. The top producing regions were ARMM at 0.54 million mt; Northern Mindanao, 0.40 million mt; and SOCCSKSARGEN, 0.26 million mt (Figure 7). The combined output from these regions accounted for 53.4 percent of the total white corn output in the country.

Yellow corn production at 5.51 million mt was 70.9 percent of the total corn output in 2014. The top producing regions and their corresponding outputs were Cagayan Valley, 1.81 million mt; SOCCSKSARGEN, 1.07 million mt; and Northern Mindanao, 0.80 million mt (Figure 8). Area harvested from these regions combined to 888.70 thousand hectares or 34.0 percent of the country's total harvest area.

In terms of yield, Central Luzon posted the highest yield at 5.53 mt per hectare. Ilocos Region and Cagayan Valley followed with 5.43 mt and 4.24 mt per hectare, respectively.

B. FRUIT CROPS

BANANA

The annual banana production from 2010 to 2014 dropped by an average of 0.5 percent annually, an improvement to the annual average drop of 1.0 percent from 2009 to 2013. This indicated that the banana industry is on its way to recovery from the devastation of Typhoon Pablo in 2012. Area planted during the same period contracted by an average of 0.4 percent annually. Bearing trees, on the other hand, grew annually by an average of 0.7 percent (Figure 11).

Banana production in 2014 increased by 2.8 percent or from 8.65 million mt in 2013 to 8.88 million mt in 2014. This could be drawn from the increases in bearing hills, harvested area and yield in major producing regions in Mindanao. Yield posted an improvement of 20.07 mt per hectare compared to the 19.39 mt in 2013. Area planted slowed down by 0.7 percent to 442.75 thousand hectares from the 2013 level of 446.02 thousand hectares.

The top banana producing regions were Davao Region, Northern Mindanao and SOCCSKSARGEN. The combined output of these regions reached 6.35 million mt or 71.5 percent of the country's banana production (Figure 12). In terms of area planted, Davao Region shared 19.5 percent, Northern Mindanao; 11.8 percent; and ARMM, 7.6 percent of the national total area planted to banana

(Figure 13). These three (3) regions recorded the highest yield at 38.95 mt per hectare in Davao Region, 37.51 mt in SOCCSKSARGEN and 34.18 mt in Northern Mindanao.

Cavendish variety. From 2010 to 2014, Cavendish production dropped by an average of 0.7 percent annually. This variety comprised 50.1 percent (Figure 14) of the country's banana production. During the period, area planted and number of bearing hills expanded annually by an average of 1.4 percent and 1.3 percent, respectively.

In 2014, cavendish variety production was 4.45 million mt or 5.2 percent higher than the 4.23 million mt level in 2013. Increased bearing hills and harvested area across Davao Region and expansion of plantation farms in Northern Mindanao, Caraga and Central Visayas contributed to the production increment in 2014.

Davao Region remained as the top cavendish producing region contributing 57.1 percent to the national cavendish banana production. Northern Mindanao ranked second and shared 25.8 percent of the total cavendish production in 2014. Area planted to cavendish variety was 84.13 thousand hectares or 1.5 percent more than the 82.90 thousand hectares in 2013. The highest number of bearing trees was in Davao Region and comprised 60.6 percent of the national total. The shares of other major producing regions were 21.8 percent in Northern Mindanao and 12.2 percent in SOCCSKSARGEN. Yield per hectare was on its way to recovery at 52.87 mt per hectare from the 51.02 mt in 2013.

Lakatan variety. Lakatan production from 2010 to 2014 posted a positive growth by an average of 0.9 percent annually. This variety represented 10.7 percent (Figure 4) of the total banana production in 2014. Number of bearing hills recorded an uptrend at an average annual rate of 0.6 percent. Area planted contracted at an average annual rate of 0.1 percent during the same period.

In 2014, a 2.7 percent growth or 954.86 thousand mt of lakatan variety was reported from the 2013 output of 930.03 thousand mt. Area planted was nearly flat at 0.9 percent higher or 56.40 thousand hectares in 2014 from the 55.91 thousand hectares in the previous year. The number of bearing hills stood at 32.54 million hills.

SOCCSKSARGEN was the top lakatan variety producing region and shared 24.2 percent of the country's output in 2014. Davao Region and Northern Mindanao followed with 22.9 percent and 17.7 percent, respectively. These three (3) regions contributed 64.8 percent of the national total lakatan production. Davao Region recorded the largest area planted with 11.29 thousand hectares or 20.0 percent of the total area planted to lakatan variety. In terms of yield, SOCCSKSARGEN posted the highest with 33.85 mt per hectare.

Saba variety. The country's saba variety production in the last five (5) years dropped by an average of 0.6 percent annually. During the period, area planted shrunk by an average of 0.5 percent. While the number of bearing trees increased annually by an average of 0.7 percent.

In 2014, saba production was 2.57 million mt or 0.4 percent higher than the 2.56 million mt output level in 2013. This variety was 28.9 percent (Figure 4) of the total banana production. The production increment was attributed to the increases in bearing hills and area planted in Davao Region, SOCCSKSARGEN and Northern Mindanao. Bigger bunches and fruits were observed in Western Visayas and Zamboanga Peninsula. The positive growth of harvests in SOCCSKSARGEN was primarily due to the sufficient rains and good market demand for banana chips processing and local exports.

Davao Region remained the highest saba variety producing region and shared 20.4 percent of the country's saba variety production. SOCCSKSARGEN followed with 14.4 percent and Northern Mindanao with 11.8 percent share of the 2014 output. In terms of area planted, Davao Region recorded the largest area planted and represented 12.1 percent of the total area planted to saba variety. CALABARZON and Western Visayas followed with about the same 9.5 percent to the country's area planted to saba variety. Consequently, Davao Region topped the most number of bearing hills and contributed 16.9 percent of the national total number of bearing hills.

CALAMANSI

Calamansi production from 2010 to 2014 was on the downtrend by an average of 3.9 percent annually. In 2010, calamansi production reached 188.34 thousand mt and was down to 160.74 thousand mt in 2014. Area planted contracted by an average of 1.1 percent while the number of bearing trees reduced by an average of 1.1 percent annually during the five-year period (Figure 15).

Calamansi production in 2014 was 160.74 thousand mt or contracted by 2.0 percent from the 164.09 thousand mt output in 2013. Cutting of old trees in MIMAROPA and Cagayan Valley and the effects of typhoon Mario in Ilocos Region, typhoon Glenda in CALABARZON and Bicol Region, and typhoon Ruby in Eastern Visayas were contributors to the drop in production. Lesser and smaller fruits were harvested this year as reported in Western Visayas and Ilocos Region. Total area planted devoted to calamansi was 20.07 thousand hectares or down by

1.0 percent from the 2013 level of 20.26 thousand hectares. There were 8.74 million bearing trees reported in 2014.

MIMAROPA remained the highest calamansi producing region and contributed 52.1 percent of the country's output in 2014. Its production reduced by 5.6 percent or 83.75 thousand mt from

last year's output of 88.75 thousand mt. CALABARZON and Central Luzon followed with a share of 7.7 percent and 6.7 percent, respectively (Figure 16). Being the highest calamansi producing region, subsequently, MIMAROPA posted the largest area planted to calamansi and highest number of bearing trees. It shared 32.8 percent (Figure 17) and 29.9 percent, respectively.

MANGO

During the period 2010 to 2014, mango production grew by an average of 1.9 percent annually. From the 2010 level, production dropped in 2011 and 2012 and bounced back in the last two (2) years. During the period, area planted slowed down by an average annual rate of 0.2 percent (Figure 18). Yield improved to 4.71 mt per hectare in 2014 from the 4.36 mt in 2010. The bearing trees went up by an average of 1.9 percent annually in the last five (5) years.

Mango production in 2014 reached 885.04 thousand mt or 8.4 percent more than the 2013 level of 816.38 thousand mt. Production gains benefitted from the increases in the number of bearing trees in Ilocos Norte, MIMAROPA, Northern Mindanao and Davao Region; increased fruiting capacity in Ilocos Region, MIMAROPA and Bicol and less incidence of pest and diseases in CALABARZON and Northern Mindanao. Weather favored during flowering and fruiting stage as observed in Cagayan Valley, Central Visayas, Davao Region and SOCCSKSARGEN. Induction of more trees in Northern Mindanao and Caraga enhanced the production in 2014. In the same year, area planted to mango expanded by 0.1 percent and the number of bearing trees by 4.4 percent.

Ilocos Region remained the top mango producing region and shared 30.6 percent

of the country's output in 2014. Zamboanga Peninsula followed as the second highest producer and contributed 12.4 percent to the total mango production (Figure 19). Central Luzon posted the largest area planted to mango with 18.1 percent (Figure 20) contribution to the national total area planted. The province recorded the highest in terms of the number of bearing trees and shared 20.2 percent of the country's total number of bearing trees. SOCCSKSARGEN shared 10.9 percent while CALABARZON contributed 10.8 percent of the total number of trees, as the second highest.

Carabao variety.

Production of carabao variety from 2010 to 2014 showed an increment by an average annual rate of 2.3 percent. Area planted during the period dropped by an average of 0.02 percent annually. The number of bearing trees during the period increased annually by an average rate of 2.6 percent. Yield improved to 4.97 mt per hectare in 2014 from the 4.55 mt in 2010.

The 2014 increment of carabao mango production was 8.7 percent or 730.14 thousand mt from the previous year's level of 671.93 thousand mt. Carabao variety represented 82.5 percent and the growth driver of the total mango production (Figure 21). Area planted to carabao variety expanded by 0.3 percent while number of

bearing trees increased by 5.9 percent compared to the level in 2013.

Carabao variety produced in Ilocos Region contributed 31.8 percent of the national carabao variety production. Its production ballooned by 4.9 percent or 231.81 thousand mt from the 221.05 thousand mt output in 2013. Zamboanga Peninsula shared 11.9 percent and Central Visayas shared 9.4 percent which ranked second and third highest producing regions. These three (3) regions comprised 53.1 percent of the national carabao variety production. Central Luzon posted the largest area with 17.2 percent of the total area planted to carabao variety. The other regions with large areas included Ilocos Region, Davao Region and SOCCSKSARGEN and accounted for 33.7 percent of the country's area planted to carabao variety. Central Luzon reported the highest number of bearing trees and contributed 19.3 percent of the country's total number of trees.

PINEAPPLE

Pineapple production in the last five (5) years expanded by an average of 3.7 percent annually or 2.51 million mt in 2014 from 2.17 million mt in 2010. Area during the period went up by an average annual rate of 1.3 percent (Figure 22). Yield improved to 40.67 mt per hectare in 2014 from 37.05 mt in 2010.

In 2014, pineapple production was 2.51 million mt or 2.0 percent more than the 2013 level of 2.46 million mt. The production increment was primarily due to the increases in area harvested from the expansion of corporate farms in Northern Mindanao and Caraga. This was coupled with the increases in area in Cagayan Valley, Central Luzon, Western and Central Visayas. There were reports of bigger and more fruits harvested in Ilocos Region, Cagayan Valley, Central Luzon, MIMAROPA, and Western Visayas. The increment of

production in Zamboanga Peninsula was due to fertilizer application and in Davao Region due to sufficient rainfall. Area expanded by 1.3 percent or 61.64 thousand hectares in 2014 from the 60.7 thousand hectares in 2013.

Northern Mindanao and SOCCSKSARGEN remained the top producing regions. Their combined contribution to the national pineapple

production was 87.6 percent (Figure 23). The largest area was topped by SOCCSKSARGEN, 39.8 percent (Figure 24) while yield was ruled by Northern Mindanao, 57.79 mt per hectare.

C. NON-FOOD & INDUSTRIAL CROPS

ABACA

Production of abaca fibers during the five-year period went up at an average annual rate of 0.6 percent. However, area planted decreased by 0.04 percent. In 2014, production slightly increased to 68.05 thousand mt from 64.95 thousand mt in 2013 or by 4.8 percent (Figure 25). The highest increment was recorded in Bicol Region at 4.87 thousand mt or by 20.2 percent and was attributed to more harvesting and stripping due to good price and increased demand in Catanduanes.

The top abaca producer was Bicol Region at 28.95 thousand mt which contributed 42.5 percent to the national output. This was followed by Eastern Visayas, Davao Region, Caraga, and Autonomous Region in Muslim Mindanao (ARMM) which had a collective output of 31.90 thousand mt (Figure 26). In terms of area planted, Bicol Region, Eastern Visayas, Davao Region, Caraga, and ARMM represented 81.0 percent of the total area planted to abaca (Figure 27).

CACAO

During the period 2010-2014, production of cacao increased at an average annual rate of 2.1 percent and area planted by 6.8 percent (Figure 28). In 2014,

production of cacao increased by 11.3 percent to 5.43 thousand mt from 4.88 thousand mt in 2013. Production in Davao Region went up by 522 mt or by 13.6 percent which was attributed to more bearing trees in Compostela Valley, Davao City, and Davao del Norte.

Total area planted to cacao in 2014 was estimated at 12.03 thousand hectares. It was 27.6 percent larger than last year's 9.43 thousand hectares due to expansion areas in Davao Region. Likewise, number of bearing trees went up by 3.1 percent, from 3.59 million trees in 2013 to 3.70 million trees in 2014.

Davao Region was the top cacao producer at 4.37 thousand mt representing 80.4 percent of the national total of 5.43 thousand mt (Figure 29). The same region recorded the largest area planted at 7.45 thousand hectares accounting by about 62.0 percent of the national total (Figure 30).

CASHEW

From 2010 to 2014, cashew production grew at an average annual rate of 6.4 percent and area planted by 0.4 percent (Figure 31). In 2014, cashew production reached 170.85 thousand mt, 16.8 percent higher than the 2013 level of 146.29 thousand mt. MIMAROPA, the country's biggest cashew producer (Figure 32), recorded 18.0 percent production growth from last year's level of 138.87 thousand mt. This could be attributed to lesser occurrence of rains during flowering of the crop in Palawan. In 2014, the province shared 96.0 percent to total cashew production and accounted 91.0 percent of the total area planted.

On the other hand, area planted to cashew slightly decreased to 28.60 thousand hectares in 2014 from 28.66 thousand hectares in 2013 or by 0.2 percent. MIMAROPA, the biggest cashew producer, likewise had the largest area planted at 26.02 thousand hectares contributing 91.0 percent of the national total (Figure 33).

COCONUT

Coconut production declined from 2010 to 2014 at an average annual rate of 1.3 percent (Figure 34). In 2014, production at 14.70 million mt was 4.3 below the 15.35 million mt output in 2013. This could be traced to the adverse effects of typhoon “Yolanda” in the Visayas regions and typhoon “Glenda” in CALABARZON and Bicol Region. Trees in some parts of CALABARZON were infested by Coconut Scale Insect (CSI) while in Zamboanga Peninsula, lower production was brought by extreme heat during fruit development in Zamboanga del Sur and Zamboanga del Norte.

Total area planted to coconut was estimated at 3.50 million hectares in 2014, lesser by 1.4 percent from last year’s 3.55 million hectares. Likewise, the number of bearing trees dropped to 330.52 million in 2014 from 338.40 million in 2013 or by 2.3 percent.

Davao Region topped all other coconut producing regions with 2.33 million mt output or a share of 15.9 percent to the national total. Other top producing regions were

Northern Mindanao, Zamboanga Peninsula, CALABARZON, and ARMM which had a collective output of 6.23 million mt (Figure 35). The largest area planted to coconut was

registered in Bicol Region at 453.70 thousand hectares. This was followed by CALABARZON, 451.10 thousand hectares; Zamboanga Peninsula, 417.31 thousand hectares; Davao Region, 356.48 thousand hectares, and ARMM, 327.89 thousand hectares. These regions accounted for 57.3 percent of the total area planted to coconut in 2014 (Figure 36).

COFFEE

During the period 2010-2014, production of dried coffee berries of all varieties declined at an average annual rate of 5.4 percent. Likewise, area planted and number of bearing trees dropped by 0.8 percent and 1.5 percent, respectively (Figure 37).

In 2014, production of coffee at 75.45 thousand mt was 4.0 percent lower than last year's 78.63 thousand mt. The biggest drop in production was noted in SOCCSKSARGEN by 891.00 mt due to cutting of old and less productive trees. Heavy rains and strong wind in Sultan Kudarat affected fruit development. In Davao Region, lower production was due to shifting to production of different varieties of banana in Compostela Valley and Davao City.

Area planted to coffee increased to 117.45 thousand hectares in 2014 from 116.46 thousand hectares in 2013 or by 0.9 percent. Increases were recorded for Arabica and Robusta coffee attributed to expansion programs implemented by various agencies such as the National Greening Program of the Department of Environment and Natural Resources (NGP-DENR) and High Value Crops Development Program of the Department of Agriculture (HVCDP-DA). However, number of bearing trees contracted to 79.65 million in 2014 from 80.28 million trees in 2013 or by 0.8 percent due to cutting of trees in SOCCSKSARGEN and shifting to banana production in Davao Region.

SOCCKSARGEN, the top coffee producer in 2014 at 28.0 thousand mt accounted 8.2 percent of the country's total output. Davao Region ranked second with 11.79 thousand mt followed by ARMM with 10.35 thousand mt (Figure 38). Likewise, the three (3) regions recorded the largest area planted at 61.67 thousand hectares contributing 52.5 percent to the total area planted to coffee at 117.45 thousand hectares (Figure 39).

Of the coffee varieties, Robusta coffee recorded the biggest production at 52.17 thousand mt or a share 69.1 percent. This was followed by Arabica, 18.03 thousand mt; Excelsa, 4.73 thousand mt, and Liberica, 0.53 thousand mt (Figure 40).

bearing trees by 3.7 percent. In 2014, production at 4.73 thousand mt was 3.9 percent below the 4.92 thousand mt level in 2013.

Robusta coffee. In 2014, production was recorded at 52.17 thousand mt, 4.4

Arabica coffee.

During the period 2010-2014, production of Arabica coffee declined at an annual average rate of 1.8 percent; area planted, 0.4 percent; and number of bearing trees, 1.4 percent. In 2014, production at 18.03 thousand mt was lower by 3.0 percent than last year's 18.59 thousand mt.

Excelsa coffee.

Production of Excelsa coffee continuously decreased from 6.35 thousand mt in 2010 to 4.73 thousand mt in 2014 or by an average annual rate of 7.0 percent. During the same period, area planted declined by 3.1 percent and number of

percent lower than the 54.56 thousand mt level in 2013. Likewise, number of bearing trees dropped from 60.77 million in 2013 to 60.48 million in 2014 or by 0.5 percent. On the other hand, area planted increased to 88.42 thousand hectares in 2014 from 87.37 thousand hectares in 2013 or by 1.2 percent attributed to expansion areas in SOCCSKSARGEN.

RUBBER

Throughout the period 2010-2014, rubber production increased continuously at an average annual rate of 3.5 percent, area planted by 12.0 percent, and number of tappable trees by 7.5 percent (Figure 41). In 2014, production of

rubber cup lump improved by 1.9 percent to 453.05 thousand mt from 444.82 thousand mt in 2013. Increase was attributed to more trees tapped in rubber producing regions of SOCCSKSARGEN, ARMM, and Northern Mindanao.

Area planted to rubber was recorded at 217.69 thousand hectares, 17.4 percent more than the 2013 level of 185.48 thousand hectares. Similarly, number of tappable trees grew from 47.38 million to 52.46 million or by 10.7 percent.

The leading producers of rubber cup lump and their shares to the national output in 2014 were Zamboanga Peninsula, 191.61 thousand mt; SOCCSKSARGEN, 173.98 thousand mt, and ARMM, 54.05 thousand mt. These regions had a combined output share of 92.6 percent of the national rubber production (Figure 42). Their collective shares were 85.0 percent in terms of area planted (Figure 43) and 91.0 percent in number of tappable trees.

SUGARCANE

From 2010 to 2014, sugarcane production grew at an average annual rate of 11.6 percent while area harvested by 5.5 percent (Figure 44). Total sugarcane production was estimated at 25.03 million mt in 2014, 1.8 percent more than the 2013 level of 24.58 million mt. The biggest increments were recorded in Western Visayas at 637.83 thousand mt and in Central Visayas by 218.03 thousand mt attributed to efficient use of fertilizer in Negros Occidental and Negros Oriental. Increases were also noted in Cagayan Valley by 77.59 thousand mt, Cordillera Administrative Region (CAR), 36.81 thousand mt; and Eastern Visayas, 30.35 thousand mt due to expansions in harvest areas in Isabela, Kalinga, and Leyte.

Western Visayas remained the top sugarcane producer with 14.52 million mt accounting for 58.0 percent of the national sugarcane production (Figure 45). Other major sugarcane producers were Northern Mindanao, Central Visayas, and CALABARZON with collective output of 7.29 million mt. Western Visayas posted the largest area harvested at 215.53 thousand hectares representing about half of the country's national total (Figure 46).

TOBACCO

From 2010 to 2014, production and area planted to tobacco grew annually at an average rate of 11.0 percent and 5.0 percent, respectively (Figure 47). In 2014, production increased to 61.42 thousand mt from 53.75 thousand mt in 2013 or by 14.3 percent. The biggest increase was noted in Cagayan Valley at 3.08 thousand mt attributed to expanded areas for Burley tobacco in Isabela. In Ilocos Region, production went up by 2.96 thousand mt due to expanded areas in Ilocos Sur brought by the sustained good price of Virginia tobacco. In Ilocos Norte, higher production for Virginia and Burley tobacco was due to additional area planted from previously in-fallow areas and crop shifting from corn and mungo.

Ilocos Region, the largest producer of tobacco at 40.07 thousand mt accounted for 65.2 percent of the output in 2014. Cagayan Valley followed with 15.97 thousand mt. These two (2) regions had a combined share of 91.2 percent (Figure 48). Similarly, Ilocos Region had the largest area planted to tobacco at 23.75 thousand hectares contributing 65.8 percent to the national total (Figure 49).

In 2014, Virginia tobacco recorded the biggest production at 31.32 thousand mt or a share of 51.0 percent to the national total. Native variety had 10.17 thousand mt, and other varieties which were mostly Burley, had 19.93 thousand mt (Figure 50).

Virginia tobacco. In 2014, production of Virginia tobacco rose by 10.9 percent to 31.32 thousand mt from the 2013 level of 28.25 thousand mt. Similarly, area planted increased by 2.9 percent to 21.13 thousand hectares in 2014 from last year's 20.54 thousand hectares.

Ilocos Region posted the highest production at 29.89 thousand mt representing 95.4 percent of the country's total Virginia tobacco output. The region had the largest area planted at 18.98 thousand hectares comprising 89.8 percent of the national total.

CABBAGE

Cabbage production in 2011 of 125.31 thousand mt was lower by 2.8 percent than its 2010 level of 128.96 thousand mt. However, it managed to increase from 126.38 thousand mt in 2012 to 127.99 thousand mt in 2014 at an average annual rate of 0.7 percent (Figure 51).

The Cordillera Administrative Region (CAR) was consistently the top producer of cabbage. In 2014, it produced 99.52 thousand mt or 77.8 percent of the country's total output (Figure 52). This was followed by Central Visayas with 6.8 percent and Northern Mindanao with 5.2 percent shares.

The same trend was observed in terms of area harvested, except for Davao Region and Northern Mindanao that ranked third and fourth respectively (Figure 53).

CAMOTE

In 2010 to 2014, camote production fluctuated in a downward trend at an average annual rate of 0.9 percent (Figure 54).

Production level dropped by 1.6 percent from 2013 with 528.25 mt compared to only 519.86 mt in 2014.

Area harvested continuously decreased at an average annual rate of 5.0 percent from 109.44 thousand hectares in 2010 to 88.97 thousand hectares in 2014. Remarkable decreases in area harvested were noted in Bicol region, Central and Eastern Visayas regions, Caraga and ARMM.

Eastern Visayas was the top producer of camote in 2014 at 108.04 thousand mt or 20.8 percent of the national output (Figure 55). The second largest producer was Bicol region with 87.91 thousand mt., followed by Western Visayas with 45.08 thousand mt. Their respective shares to the national camote output were 16.9 percent and 8.7 percent, respectively.

Likewise, Eastern Visayas shared the largest area of 20.57 thousand hectares or 23.1 percent of the country's total area harvested for camote (Figure 56).

This was followed by Bicol region with 18.04 thousand hectares, Central Luzon with 6.95 thousand hectares, Western Visayas with 6.64 thousand hectares and Central Visayas with 5.97 thousand hectares of area harvested to camote.

CASSAVA

Cassava production grew at an average annual rate of 4.9 percent from 2010 to 2014 (Figure 57). The country came up with 2.54 million mt in 2014.

In 2010, area harvested to cassava was 217.62 thousand hectares. It increased to 221.24 thousand hectares in 2011 but continuously decreased to 216.78 thousand hectares in 2014 at an average annual rate of 0.7 percent.

ARMM with 1.04 million mt of cassava production in 2014 remained as the top producer. It accounted for 41.1 percent of the country's total output in 2014 (Figure 58). Northern Mindanao followed with a share of 26.1 percent and Cagayan Valley with 5.3 percent.

With 98.09 thousand hectares or 45.2 percent, ARMM shared the largest area harvested of cassava in the country (Figure 59). This was followed by Northern Mindanao with 25.82 thousand hectares and Bicol region with 22.25 thousand hectares of area harvested to cassava.

EGGPLANT

Eggplant production grew at an average annual rate of 2.0 percent from 208.24 thousand mt in 2010 to 225.58 thousand mt in 2014 (Figure 60). However, area harvested during the period contracted from 21.42 thousand hectares to 21.16 thousand hectares at an average annual rate of 0.3 percent.

In 2014, Ilocos Region remained the top producer of eggplant at 79.40 thousand mt and accounted for 35.2 percent of total production in the country (Figure 61). CALABARZON trailed with 36.87 thousand mt or 16.3 percent share to the national output. Central Luzon followed with 20.92 thousand mt or 9.3 percent of the total eggplant production in 2014.

Ilocos region as the top producer shared the largest area harvested at 4.97 thousand hectares or 23.5 percent of the country's total area devoted to eggplant (Figure 62). Central Luzon ranked second with 2.79 thousand hectares, and followed by Cagayan Valley with 1.96 thousand hectares of eggplant.

GARLIC

From 2010 to 2012, garlic production was decreasing at an average annual rate of 4.0 percent. However, in 2013 and 2014, production increased at an annual rate of 2.0 percent and 0.1 percent, respectively (Figure 63).

Area harvested to garlic decreased continuously from 2010 to 2013 at an average annual rate of 5.8 percent but managed to increase by 0.6 percent in 2014.

Ilocos Region was the leading garlic producer in 2014. Ilocos Region came up with 6.00 thousand mt output and shared 66.8 percent in the country's total production (Figure 64). MIMAROPA came next with 1.80 thousand mt or 20.0 percent share of total production in the country.

With 1.88 thousand hectares, Ilocos region shared 73.5 percent of the area harvested to garlic in the country (Figure 65). MIMAROPA trailed second with 299 hectares, followed by Cagayan Valley with 153 hectares and Central Luzon with 133 hectares of garlic in 2014.

MONGO

Mongo production fluctuated with an upward trend from 27.06 thousand mt in 2010 to 32.14 thousand mt in 2014 at an average annual rate of 4.8 percent (Figure 66). Production in 2014 was 0.9 percent less than 2013 output level of 32.42 thousand mt.

Area harvested also fluctuated. From 40.08 thousand hectares in 2010 it expanded to 45.28 thousand hectares in 2011, and went down to 42.98 thousand hectares in 2014. Yield per hectare however, increased by an average annual rate of 3.36 percent from 2010 to 2014.

Ilocos Region remained the largest producer of mongo at 12.11 thousand mt or 37.7 percent of the country's total output in 2014. Cagayan Valley followed with 7.16 thousand mt or 22.3 percent of the total production; Central Luzon, 3.49 thousand mt or 10.9 percent share; and ARMM with 2.63 thousand mt or 8.2 percent share to the total production (Figure 67).

In terms of area harvested, Cagayan Valley shared the largest at 36.6 percent or 13.59 thousand hectares of mongo harvested in 2014 (Figure 68). Ilocos region shared 26.7 percent or 9.92 thousand hectares and Western Visayas with 5.24 thousand hectares or 14.1 percent share to total mongo area in the country.

ONION

Onion production grew from 135.38 thousand mt in 2010 to 203.65 thousand mt in 2014 at an average annual rate of 12.83 percent (Figure 69). Area harvested during the period likewise expanded from 15.17 thousand hectares to 15.84 thousand hectares at an average annual rate of 1.1 percent. However, yield per hectare decreased from 8.92 mt in 2010 to 8.32 mt in 2012, but managed to recover at 8.70 mt in 2013 and to 12.85 mt in 2014.

Central Luzon, Ilocos Region and MIMAROPA were consistently the top onion producer of the country from 2010 to 2014. In 2014, the regions shared with 69.9 percent, 19.5 percent and 6.5 percent shares, respectively, to the national total (Figure 70).

Central Luzon with 8.52 thousand hectares of area harvested to onion, likewise shared the highest at 53.8 percent (Figure 71). Ilocos region trailed second with 4.59 thousand hectares, followed by MIMAROPA and Cagayan Valley with 1.92 thousand hectares and 660 hectares of onion respectively.

PEANUT

Peanut production fluctuated in a downward trend from 29.62 thousand mt in 2010 to 29.20 thousand mt in 2014 at an average annual rate of 0.4 percent (Figure 72). The decreasing trend in production was brought by the decreasing peanut farm areas in some of the top producing provinces of the country.

Ilocos Region remained the top producer of peanut in the country at 11.76 thousand mt or 40.3 percent of the national output. This was followed by Cagayan Valley with 12.5 percent and Northern Mindanao with 8.4 percent shares (Figure 73).

The same trend in production was observed in top area harvested by region. Except for Western Visayas and Northern Mindanao that ranked third and fourth respectively, Ilocos region followed by Cagayan Valley shared the largest area harvested to onion in the country in 2014 (Figure 74).

TOMATO

Tomato production in 2010 was 204.27 thousand mt. It decreased by 0.3 percent in 2011 but managed to increase from 203.59 thousand mt in 2012 to 214.57 thousand mt in 2014 at an average annual rate of 1.8 percent (Figure 75). This was attributed to favorable weather condition during the flowering and fruit development stages of the crop in most top tomato producing regions of the country. On the other hand, area harvested contracted from 17.66 thousand hectares in 2010 to 16.74 thousand hectares in 2014 at an average annual rate of 1.3 percent. However, yield per hectare continuously increased from 11.57 mt in 2010 to 12.82 mt in 2014 at an average annual rate of 2.6 percent.

Ilocos Region was the consistent top producer of tomato with 72.51 thousand mt or 33.8 percent of the country's total production in 2014 (Figure 76). The other top producing regions and their shares to the national total production were Northern Mindanao, 22.3 percent; Central Luzon, 11.1 percent; and CALABARZON, 9.0 percent.

In 2014, Ilocos region shared the largest tomato area harvested at 3.82 thousand hectares or 22.8 percent of the country's tomato farm area (Figure 77). This was followed by Central Luzon with 3.48 thousand hectares and Northern Mindanao with 2.63 thousand hectares of tomatoes.

OTHER VEGETABLES

Figures 78, 79, 80 and 81 show the trends of production of other vegetables. Production of gourd continuously decreased from 2010 to 2014 at an average rate of 3.9 percent (Figure 78).

Only broccoli production managed to increase continuously from 2010 to 2014 at an annual average rate of 3.2 percent (Figure 79).

Productions of the rest of the other vegetables show fluctuating trends from 2010 to 2014 (Figures 79, 80 & 81).

Lettuce, Chinese pechay and okra production were lower in 2011 than the 2010 level but managed to increase from 2012 to 2014, while ubi and white potato production continuously to decreased from 2010 to 2013 and bounced back only in 2014.

Vegetables with an increasing trend from 2011 to 2014 are cauliflower, habitchuelas and carrots. While those that showed decreasing trend are ginger and ubi.
